Profile

LegalTech co-founder with hands-on B2B SaaS product work and 7+ years of team and process management. I translate business needs into development scope, user stories and acceptance criteria, then review the result with developers. My contribution is making workflows, ownership and priorities clear so the team can build and validate a coherent product.

Product experience

LegalStepy | Co-Founder and COO | 2025 - Present

- Define the full contract lifecycle, from drafting and creation through collaboration, negotiation, approvals and signing to renewals and obligations; make roles and hand-offs explicit so the developer can build a connected workflow.
- Turn business needs into prioritised requirements, user stories and acceptance criteria, including exceptions; give the team a shared basis for implementation and acceptance.
- Prioritise one complete MVP journey and review demos and feedback to identify gaps in versions, permissions and transitions before expanding the product scope.

Ventures HQ | Independent product project | 2026

- Initiated an internal platform for tasks, projects, bug tracking, CRM and a knowledge base; define the modules and review delivery through AI-assisted development, giving the team one workspace for work and related information.
- Define priority-task views and explicit Edit / Save behaviour; test workspace access and consistency between Board and List so issues have clear expected behaviour and daily work is easier to follow.

Operations and project leadership

Evolution Georgia | Shufflers Team Manager | 2019 - Present

- Manage daily workflows, team performance and recurring operational issues; coordinate corrective actions with relevant teams to keep responsibilities and follow-up clear in a time-sensitive iGaming operation.
- Lead the Golden Mentors project involving 100+ mentors; coordinate onboarding, documentation and quality checks to support consistent guidance for newcomers.

Skills and tools

Product management: Customer discovery, Requirements analysis, Backlog prioritisation, Roadmap and MVP scope, User stories and acceptance criteria, UX feedback, UAT and validation, Product measurement planning.

Project management: Scope and delivery planning, Stakeholder coordination, Dependency tracking, Risk and issue follow-up, Process mapping, Cross-functional communication, Agile and Scrum collaboration, KPI reporting.
